**Function Field Arithmetic** May 14 2021 This book provides an exposition of function field arithmetic with emphasis on recent developments concerning Drinfeld modules, the arithmetic of special values of transcendental functions (such as zeta and gamma functions and their interpolations), diophantine approximation and related interesting open problems.

**Local Fields and Their Extensions: Second Edition** Aug 05 2020 This book offers a modern exposition of the arithmetical properties of local fields using explicit and constructive tools and methods. It has been ten years since the publication of the first edition, and, according to Mathematical Reviews, 1,000 papers on local fields have been published during that period. This edition incorporates improvements to the first edition, with 60 additional pages reflecting several aspects of the developments in local number theory. The volume consists of four parts: elementary properties of local fields, class field theory for various types of local fields and generalizations, explicit formulas for the Hilbert pairing, and Milnor  $\pi$ -groups of fields and of local fields. The first three parts essentially simplify, revise, and update the first edition. The book includes the following recent topics: Fontaine-Wintenberger theory of arithmetically profinite extensions and fields of norms, explicit noncohomological approach to the reciprocity map with a review of all other approaches to local class field theory, Fesenko's  $\pi$ -class field theory for local fields with perfect residue field, simplified updated presentation of Vostokov's explicit formulas for the Hilbert norm residue symbol, and Milnor  $\pi$ -groups of local fields. Numerous exercises introduce the reader to other important recent results in local number theory, and an extensive bibliography provides a guide to related areas.

**Foundations of Galois Theory** Jul 24 2019 Foundations of Galois Theory is an introduction to group theory, field theory, and the basic concepts of abstract algebra. The text is divided into two parts. Part I presents the elements of Galois Theory, in which chapters are devoted to the presentation of the elements of field theory, facts from the theory of groups, and the applications of Galois Theory. Part II focuses on the development of general Galois Theory and its use in the solution of equations by radicals. Equations that are solvable by radicals; the construction of equations solvable by radicals; and the unsolvability by radicals of the general equation of degree  $n \geq 5$  are discussed as well. Mathematicians, physicists, researchers, and students of mathematics will find this book highly useful.

**Kac-Moody Groups, their Flag Varieties and Representation Theory** Mar 12 2021 Kac-Moody Lie algebras  $\mathfrak{g}$  were introduced in the mid-1960s independently by V. Kac and R. Moody, generalizing the finite-dimensional semisimple Lie algebras which we refer to as the finite case. The theory has undergone tremendous developments in various directions and connections with diverse areas abound, including mathematical physics, so much so that this theory has become a standard tool in mathematics. A detailed treatment of the Lie algebra aspect of the theory can be found in V. Kac's book [Kac-90] This self-contained work treats the algebro-geometric and the topological aspects of Kac-Moody theory from scratch. The emphasis is on the study of the Kac-Moody groups  $G$  and their flag varieties  $XY$ , including their detailed construction, and their applications to the representation theory of  $\mathfrak{g}$ . In the finite case,  $\mathfrak{g}$  is nothing but a semisimple  $\mathfrak{Y}$  simply-connected algebraic group and  $X$  is the flag variety  $\mathfrak{g}/P_{\mathfrak{y}}$  for a parabolic subgroup  $p_{\mathfrak{y}} \subset \mathfrak{C} \mathfrak{g}$ .
