Electrode Processes and Electrochemical Engineering Oct 15 2020 This book has been planned and written by Dr. Hine with his knowledge and experience in electrochemical science and engineering for over thirty years since he joined with me at Kyoto University in 1948. This book is unique and is useful for engineers as well as scientists who are going to work in any interdisciplinary field connected with electrochemistry. Science is sure to clarify the truth of nature as well as bring prosperity and an improvement to the welfare of human beings. The origin of the word "science" is the same as of "conscience," which means the truth of our heart. When we consider a scientific and technological subject, first we classify it into the components and/or factors involved, and then we clarify them individually. Second, we combine them to grasp the whole meaning and feature of the subject under discussion. Computers may help us greatly, but how to establish the software that will be most desirable for our purposes is of great importance. We need to make these efforts ourselves, and not decorate with borrowed plumes. With this concept in mind, this book is attractive because the author describes the basic science in electrochemistry and practice, and discusses the electrochemical engineering applications as a combination of science and technology.

Principles of Materials Characterization and Metrology Apr 08 2020 Characterization enables a microscopic understanding of the fundamental properties of materials (Science) to predict their macroscopic behaviour (Engineering). With this focus, Principles of Materials Characterization and Metrology presents a comprehensive discussion of the principles of materials characterization and metrology. Characterization techniques are introduced through elementary concepts of bonding, electronic structure of molecules and solids, and the arrangement of atoms in crystals. Then, the range of electrons, photons, ions, neutrons and scanning probes, used in characterization, including their generation and related beam-solid interactions that determine or limit their use, is presented. This is followed by ion-scattering methods, optics, optical diffraction, microscopy, and ellipsometry. Generalization of Fraunhofer diffraction to scattering by a three-dimensional arrangement of atoms in crystals leads to X-ray, electron, and neutron diffraction methods, both from surfaces and the bulk. Discussion of transmission and analytical electron microscopy, including recent developments, is followed by chapters on scanning electron microscopy and scanning probe microscopies. The book concludes with elaborate tables to provide a convenient and easily accessible way of summarizing the key points, features, and inter-relatedness of the different spectroscopy, diffraction, and imaging techniques presented throughout. Principles of Materials Characterization and Metrology uniquely combines a discussion of the physical principles and practical application of these characterization techniques to explain and illustrate the fundamental properties of a wide range of materials in a tool-based approach. Based on forty years of teaching and research, this book incorporates worked examples, to test the reader's knowledge with extensive questions and exercises.

Color Measurement Jul 24 2021 Reviews and use of the first edition as the textbook for a senior-division university course indicated the need for a number of corrections and clarifications. Although no new topics have been introduced, the new edition should be more clear and useful. A novelty in the Notes and Sources Appendix should facilitate reference from the notes back to the text. For that purpose, the page number of the text to which each note refers is indicated in square brackets following the serial number of the note. The FMC1 color-difference formula has been substituted everywhere for the Friele-MacAdam formula, including the reference to the sources in Note 52. The FMC1 formula was actually used in the investigations reviewed in Sects. 8.3 and 8.4. The Friele-MacAdam formula given on page 151 of the first edition, which I thought was equivalent to the FMC1, was erroneous and should not be used. The formulas for the geodesic chromaticity diagram, on p. 153 of the first edition, were based on observations by 14 normal observers (last reference in Note 51). They have been replaced by the formulas based on the observations of PON, for consistency with all other formulas and discussions in the book. Figure 8.29 in the first edition was based on the PON data and on the formulas printed below it in the new edition. Therefore, Fig. 8.29 is unchanged.

In Praise of Beer Feb 28 2022 "There is a supposed Chinese curse that says 'May you live in interesting times'. There is no doubt whatsoever that, when it comes to beer, these most certainly are extremely interesting times. In China, itself, the brewing of beer accelerated at an astonishing rate in the past couple of decades. Elsewhere, in a huge range of countries but perhaps best typified by the likes of the United States, United Kingdom and Australia, there is a burgeoning so-called craft sector, with a vast growth in the number of brewing companies. Here in California, as elsewhere, there is no end to the ingenuity of these brewers, who are forever pushing the boundaries in terms of styles, ingredients and presentation of products that can either delight, disturb or distress the drinker, depending on perceptions, preferences and pre-conceived biases. No matter, the reality is that the beer world is emerging and exciting. There is an ongoing need for new brewers who are well-informed and capable - for which folks like me, whose day job has been to make a living out of teaching, are inordinately grateful. Equally, there seems to be a growing thirst from customers, not only for the beers themselves but also for an understanding of what they are drinking. Most of the books I have written over a quarter of a century have primarily been targeted at the producers of beer. This one, however, has been penned largely with the customer in mind, although I hope that won't stop those employed by brewing companies from reading it, because they sure need to know what I am preaching to the customer. Customers are becoming more knowledgeable and, therefore, more choosy and, yes, demanding. It's a good thing, provided they speak from a position of genuine understanding. I hope that this volume will help"--

Solvent Gels for the Cleaning of Works of Art Dec 17 2020 The cleaning of a work of art often involves removing not only dirt and grime but also unwanted layers of varnish, gilding, and paint from the work's surface. The challenge for conservators lies in finding a cleaning agent that will act on one layer without affecting the layer being preserved and without leaving any harmful residues on the cleaned work. This book, which examines gel cleaning in the treatment of paintings and painted works of art, presents the methodologies, data, and results of a collaborative project of the Getty Conservation Institute and Winterthur Museum. Among the issues covered are the theory and application of gel cleaning systems, the detection of residues left on the surfaces of objects cleaned with these systems, research into solvent-gel and solvent residues, stability of surfactants during natural and artificial aging, and recommendations for formulating gels for specific cleaning tasks.
